

ELEMENT 24 SERIES TECHNICAL BULLETIN EXOSHELL ROOF

Authored: Monday, January 03, 2011

The Element 24 series product line utilizes a durable polymer roof coating which is bonded to the roof surface to create a seamless exterior membrane. The polymer roof coating is more resistant to punctures, tears, scuffs, cracks, bubbles, and slices than conventional EPDM and TPO sheet membranes. The polymer roof coating does not contribute to black sidewall streaks as is common with EPDM roof membranes. The polymer coating can be easily spot repaired if needed without replacement of the entire roof membrane and requires no special cleaning or sealing as part of normal maintenance.
